How the game works

Goal get every object onto its target cell, moving one object one square per turn.

Player A moves A C D and Player B moves B E F. Neither can move the other's objects, and neither can see them: a teammate's object shows only as X, as in the middle board below. So the only way to get one out of your way is to ask for it, in words, and hope the teammate agrees.

A I'm moving D toward its target at (R1,C5) through the upper corridor when it's clear. I'll keep the left column open for your R8C2 X if needed. My A target is (R5,C3), so please clear that cell for me; I can adapt once your X moves. … PLAN: move D from (R2,C1) to (R1,C5) — REQUEST: clear R5C3 for A — `move: D right`

B Moving B down to R6C3 frees R5C3 for your A. Please move X at R6C2 left to R6C1 so B can finish at R6C2. … PLAN: move B from (R5,C3) to (R6,C2) — REQUEST: move X from (R6,C2) to (R6,C1) — `move: B down`

A Moving C left to R6C1, freeing R6C2 for B as you asked. I'll route A through R3C2-R3C4 then R5C4 to R5C3, so please move E off R4C4 when A approaches. … PLAN: move C from (R6,C2) to (R7,C7) — REQUEST: move B to (R6,C2); clear (R4,C4) for A — `move: C left`

B Taking B into R6C2 now, as planned. I'll move E right to R4C5 next, freeing R4C4 so A can pass; after A clears row 3, E will cross via R3C4-R3C1 to R5C1. Please hold D out of R3C2-R3C4 until E has passed. … PLAN: move B from (R6,C3) to (R6,C2) — REQUEST: hold D off (R3,C2)-(R3,C4) until E passes — `move: B left`
