S2

WHAT A PLAYER MUST INFER

- that A ← B ← C is a dependency chain, resolved in the order C → B → A
- that the walls put a median detour of 1.73× the direct distance on the six objects

---

S2 adds the two elementary forms of structure the upper levels compound: walls that lengthen paths, and a dependency that orders them. The chain fixes which target must be vacated before which, but leaves the model free to choose where the displaced object parks.
