S3

WHAT A PLAYER MUST INFER

- that R4C5–R1C5 is a dead-end corridor, reachable only through R5C5
- that A ← B ← C ← D is a dependency chain, resolved in the order D → C → B → A
- that E ← F is a dependency chain, resolved in the order F → E
- that the walls put a median detour of 1.32× the direct distance on the six objects

S3 removes that discretion. Because the corridor entrance is its only access, the geometry rather than the model's judgement fixes the order in which targets can be occupied, and a second chain outside the corridor must be interleaved with the corridor plan.
