S4

WHAT A PLAYER MUST INFER

- that R5C5–R8C5 is a dead-end corridor, reachable only through R4C5
- that A is aiming for the cell B occupies, so A must retreat clear of R4C5 and give up ground before B can leave
- that C ← D ← E ← F is a dependency chain, resolved in the order F → E → D → C
- that the walls put a median detour of 1.20× the direct distance on the six objects

---

S4 isolates the one demand the lower levels never impose: a correct plan whose prefix moves an object away from its own target. It is the adversarial case for a stepwise-greedy policy.
