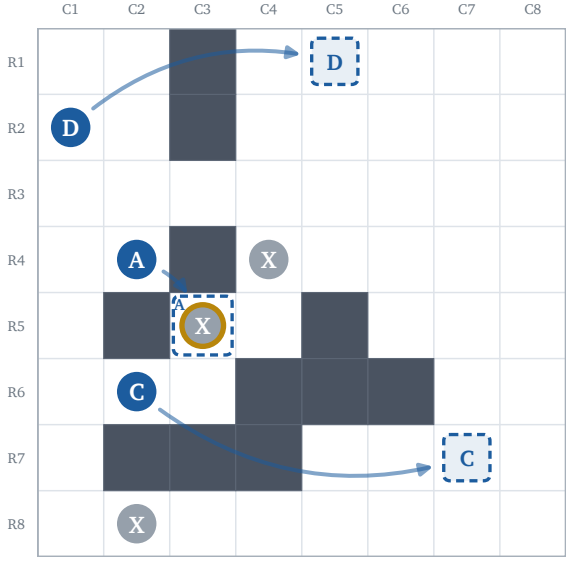
The same board, as each player is shown it

S2 · instance 2 · optimal 35 moves

Six objects, two players, three each. An arrow marks where one object must end up, not the route it takes. Neither player is ever shown the other panel.

What Player A sees

owns A, C, D · the other three are only X

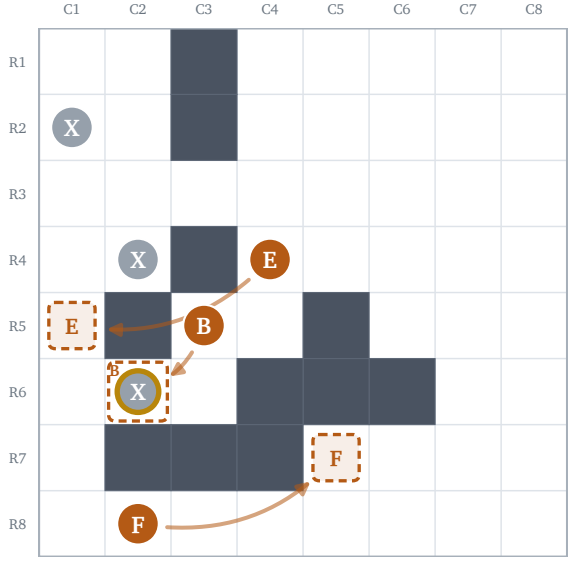


Objects: A@R4C2 X@R5C3 C@R6C2 D@R2C1 X@R4C4 X@R8C2

Targets: A->R5C3 C->R7C7 D->R1C5

What Player B sees

owns B, E, F · the other three are only X



Objects: X@R4C2 B@R5C3 X@R6C2 X@R2C1 E@R4C4 F@R8C2

Targets: B->R6C2 E->R5C1 F->R7C5

Each player has exactly one arrow ending on an X: the cell it must reach is held by an object it can neither identify nor move.

That is the whole game. The channel is the only way either player can learn what the other panel says, or get an X out of the way.

- an object this player owns and may move
- where one of its objects must end up
- object → its destination
- occupied, by what and whose is not shown
- an X standing on a cell this player needs
- wall, impassable
